DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on 7/14/03 has been entered.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 39 and 40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bagwell et al (Nucleic Acids Research 1994, Vol. 22, No.12 pp. 2424-2425) in view of Urdea et al. (4,775,619).

Bagwell et al. discloses a single molecule assay system. The assay involves a UniFluor probe which is a two hairpin oligonucleotide that when in contact with specific sequences, changes its conformation with resultant increase in fluorescence. See Figure 1. When the UniFluor probe interacts with a target, the competitive arms are displaced increasing the distance between Q groups, resulting in a detectable change in fluorescence intensity.

Urdea et al. discloses methods for diagnosis employing polynucleotides having oligonucleotide sequences substantially homologous to a sequence of interest. Methods are provided for the detection of specific nucleotide sequences employing a solid support (col. 2-9).

Therefore it would have been obvious at the time the invention was made to provide a labeled probe attached to a solid support as disclosed by Urdea for the methods of Bagwell. The motivation is that hybridization assay can be carried out by attaching probes to a surface. Detection of sequences has involved various hybridization techniques requiring the binding of a polynucleotide sequence to a support and employing labeled probe (Urdea et al. col. 1 and 17).
